

Managed Firewall & Virtual Private Network (VPN)

Turnkey solutions to protect your data and business

Enterprises face an ever-increasing need to provide their employees, vendors, and mobile workforce access to their corporate LAN while keeping unwanted visitors out. Without a robust firewall and VPN solution, enterprises run the risk of damages from hackers, viruses, and other malicious content threatening their network and data integrity.

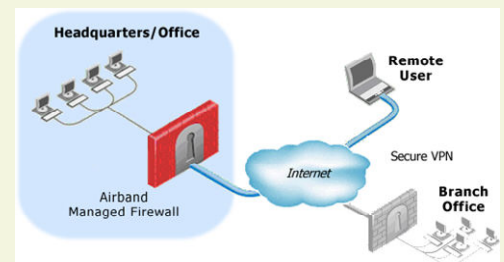

Airband provides the expertise required to configure, proactively monitor and manage a robust solution that delivers the level of confidence that businesses demand in their IT security strategy.

Complete Suite of Managed Security Solutions: Three key product features are combined for end-to-end managed security:

- 1 **Stateful firewall** protects your LAN from viruses and other malicious content. Intrusion protection blocks network attacks before they negatively impact an organization's information assets.
- 2 **Integrated VPN** capabilities provide remote access security for mobile workers as well as site-to-site secured connectivity for branch offices.
- 3 **Anti-virus, anti-spam, and content filtering** capabilities can be bundled to protect end-users from malicious content, filter unwanted e-mails, and stop the inappropriate use of the corporate LAN.

KEY BENEFITS

- Fully managed solution
- Certified installation
- Proactive monitoring
- Software updates
- Secured network connectivity
- Data & VOIP traffic protection
